

How to Fit and Seal the Windows

Windows are pinned into position using the panel pins provided as shown in the image below.

You will then need to seal the windows to make your building is weatherproof. The framing and glazing needs to be completely dry in order to efficiently seal the windows. You need to use your preference of sealant products both inside and out such as silicone, mastic, or putty. You may also wish to use beading to reinforce the panes.

If you have purchased a glazing kit from us you will find beading and a silicone and gun set which will help you to seal the windows in to place.
